Experience

Full-Stack Developer Intern, Ankageo – Başakşehir, İstanbul June 2026 – July 2026

Built a full-stack network diagnostics toolkit integrating DNS, traceroute, WHOIS, and ASN lookups, with per-user history and statistics secured behind JWT-based authentication.

- Built backend with **Hono**, **Prisma**, and **SQLite**, featuring 1-hour response caching, **Zod** validation, and httpOnly-cookie sessions.
- Developed **React** + **Vite** frontend with paginated history and statistics dashboards, deployed on **AWS EC2** via **Nginx**, and GitHub Actions CI/CD.

Education

Sakarya University, BSc in Computer Science – Sakarya, Türkiye Sept 2021 – Sept 2026

- Selected Coursework
 - Introduction to Cryptology – classical and modern crypto primitives, symmetric and public-key systems
 - Network Programming – socket APIs, concurrency, client-server systems
 - System Administration – server management, virtualization, network services

Projects

SDN-Based Automated Threat Detection and Mitigation System – Capstone Project Jan 2026 – June 2026

Built an SDN-based intrusion response system with **Suricata** and **Ryu** to detect and mitigate attacks on a simulated enterprise WAN.

- Built a **Python** alert pipeline from Suricata EVE JSON to **Ryu** and **OpenFlow 1.3** rules on **Open vSwitch**.
- Designed a segmented **Mininet** WAN with OVS port mirroring and automated orchestration with **Bash**.
- Implemented **Scapy** attack simulations covering floods, scans, ARP spoofing, MAC flooding, and brute-force attempts.

P2P File Exchange – github.com/ozan2003/p2p_file_exchange

Built a secure peer-to-peer file transfer desktop application for local networks using **C#** and **Avalonia UI**.

- Implemented UDP-based peer discovery with Ed25519-signed announcements to mitigate impersonation attacks.
- Built end-to-end encrypted file transfers over TCP using X25519 key exchange and ChaCha20-Poly1305 authenticated encryption.
- Implemented trust-on-first-use identity verification backed by a persistent **SQLite** trust database.

RFC Reader – github.com/ozan2003/rfc_reader

Developed a **Rust** terminal application for browsing IETF RFCs using a TUI built with Ratatui, optimized for keyboard-driven navigation.

- Implemented an HTTP fetch and persistent on-disk caching layer to support offline mode, reduce repeated network calls, and improve document load latency.
- Built full-text search over the document with in-app highlighting/navigation to accelerate lookup of protocol keywords and sections.

Skills

Programming Languages: Python, Rust, C#, Bash

Tools: GNU Make, pytest, Git, uv

Network Simulation: Cisco Packet Tracer

RDBMS: SQLite

Languages: Turkish, English (YDS: 87.5)
